Get a start with CANalyzer, then quickly evolve your CAN and OBD-II communication tools with our other products. The CANalyzer tool is a set of functions designed to help you to monitor the CAN bus. Its functionality is very broad and includes all the basic functions of a CAN bus analyzer. With this software you can save, view, read and modify data stored on the CAN bus. The program is a multi-threaded application that works with multiple tools, making it an ideal tool to diagnose problems on the CAN bus, and to monitor the status of vehicle systems, and to set up new applications and solutions. CANalyzer Description: CANalyzer is a simple tool to view the status of CAN bus messages, changes, write and read CAN bus configurations and send CAN bus messages. It is a multi-threaded application and combines several functions within one program. CanView (C++ GUI) is a software for reading and writing CAN bus frames, created to be used as an easy and powerful tool in the development of CAN applications. It reads and writes CAN frames from and to files or to and from a CAN bus. It is easy to use and can be used from command line as well as a graphical user interface. CanView Description: CanView is an easy-to-use and powerful software for reading and writing CAN frames from and to files. It can also be used from the command line as well as a graphical user interface. CanView is also fully Unicode compliant. CanView Shield is a program that includes all functions of CanView. It is a program that allows you to read and write CAN bus frames and files to and from a CAN bus,

directly on your PC. Shield has a graphical user interface and can be used from command line.

What's New in the CANSniffer?

CANSniffer was written to be a useful tool for a CAN Bus controller that has a embedded CAN bus. The program records the CAN bus communication data using the DBC format. It can be started with an image file that has been saved on the controller. The application can be started without a file and a DBC file can be used. ** Log File Save Log Files from the CANBus data in the application folder. The logger is used to save the CAN bus data in the DBC file format. Example: The application prints the data recorded in the logger at a certain moment. ** Application Settings

1. Open the file application.ini in the application folder.
2. The option to save the settings of the CANBus controller can be changed on the application.ini
3. The CANBus controller type, CANBus controller address and the CANBus controller port number that you use can be defined.
4. The application can be started without a file and without a log file.

1. Define the CANBus controller type in the application.ini file: Type=CANBusController
2. The CANBus controller address can be defined in the application.ini file.
3. The CANBus controller port number can be defined in the application.ini file.
4. The application can be started without a file and without a log file.

** Log File Setup Open the application folder and open the application.ini file.

1. Add the log file at the end of the line.
2. The port number and data size can be set in the application.ini file. Example: [CANSniffer.DBC.Logger] filename=CANlogger baudrate=9600
3. Start the application with an image file and open the CANBusController.DBC file in the application folder.
4. You can view the ECU parameters saved in the DBC file.

** Commands Switch between the CANBus controllers. The console of the CANBus controller changes between the CANBus controllers.

1. Launch the application.
2. Click on the controller icon on the application to open the controller console.
3. Use the buttons to select the CANBus controller. Example: Use the buttons to change the CANBus controllers.

** ECU Parameter and Message Information

1. The CANBus controller allows you to

view the ECU parameters and messages. 2. A single ECU parameter can be viewed and a simple message can be selected. 3. The CANBus controllers can be selected. Example: A single ECU parameter can be viewed and a simple message can be selected. ** ECU Parameters
