It is often desirable to have a priori knowledge of the weather conditions in a vehicle prior to leaving it on a remote parking lot. If such information is not available, one can be forced to purchase a weather oriented parking lot with a suitable display and a few radios to broadcast weather information. This is not entirely satisfactory because it is usually difficult to determine the location of such remote parking lots, it is usually expensive, and a suitable display is normally quite expensive. Another method which has been proposed to identify the weather conditions in a

vehicle is to measure the weight of rain water on the vehicle's windshield. Such a method, however, provides little useful information, is difficult to use, and is not always reliable. It is therefore an object of the present invention to provide an improved method and apparatus for identifying the presence of water in a vehicle. It is a further object of the present invention to provide an improved method and apparatus for remotely identifying the presence of
